Summary

Full-stack software engineer with over 10 years of experience designing and shipping distributed systems, RESTful APIs, and cloud-native infrastructure across financial and enterprise SaaS applications. Equally comfortable deep in backend services (Java, .NET Core, Golang) and frontend applications (React, Redux, JavaScript, TypeScript), with hands-on expertise in DevOps tooling — CI/CD pipelines, Kubernetes, Docker, Terraform, and AWS. Proven ability to lead modernization efforts, integrate complex third-party platforms, and build resilient systems in regulated environments (SOC 2, DORA).

Technical Skills

Languages: Go, Java, C# (.NET Core), JavaScript, TypeScript, Python, Bash

Frontend: React, Redux, HTML/CSS

Backend & APIs: REST, SOAP, Node.js, gRPC / Protocol Buffers, Microservices, Event-driven architecture

Databases: PostgreSQL, MSSQL, Redis, InfluxDB

Messaging: AWS SQS/SNS, ActiveMQ, RabbitMQ, Kafka

Cloud & Infrastructure: AWS, Kubernetes, Docker, Terraform, GitHub Actions, Jenkins, Spinnaker

Observability: Datadog, Prometheus, Grafana

Other: SOC 2 Type II, DORA compliance, Agile / Scrum, Salesforce / Apex, Apache ServiceMix/Karaf, JasperReports, Hibernate, Siesta / Selenium, Struts

Experience

M2 Systems Corporation | Senior Software Developer | 03/2024 – 03/2026

- Developed issuer-side integration in Golang for Mastercard's Digital Enablement Service (MDES), enabling card tokenization for Apple Pay and Google Wallet for EU partner banks.
- Contributed to gRPC/Protocol Buffers APIs supporting payment processing and authorization services for EU financial institutions.
- Built ancillary services including a webhook notification producer for transaction and status-change events, and a fraud detection service triggered during card digitization.
- Led Java modernization effort, upgrading services from Java 7 to 11 and migrating the build process from manual javac compilation to Gradle, reducing build complexity and improving dependency management across the codebase.
- Architected and led a full platform rewrite from Java to Go and introduced an automated CI pipeline using GitHub Actions covering 10+ services and repositories — enabling build, test, and containerization on every push. Reduced dependency size by 87%.

Conga | Senior Software Engineer | 05/2021 – 02/2024

- Collaborated with product management and architects on a 50+ person engineering team to design and build RESTful APIs for an e-signature platform comprising multiple orchestrated microservices in .NET Core.
- Implemented event-driven architecture using AWS SQS/SNS to decouple microservices and improve system resilience.
- Developed React application leveraging an in-house component library, integrating with e-signature APIs and managing global state with Redux.
- Owned planning, building, and deploying monthly releases using GitHub Actions + Jenkins (CI) and Spinnaker pipelines (CD).
- Modularized Terraform infrastructure, decomposing monolithic components into reusable templates that were version controlled and adopted by 5 teams across the organization to standardize stack provisioning.

Conga | Software Engineer | 06/2018 – 05/2021

- Contributed full-stack development for an e-signature application with native Salesforce integration, including custom Apex classes, Lightning Web Components (SLDS), Java APIs, React frontend, and PostgreSQL persistence layer.
- Contributed to the migration of production infrastructure from AWS Elastic Beanstalk to Kubernetes, improving scalability, manageability, and deployment consistency.
- Maintained SOC 2 Type II compliance by planning and executing annual disaster recovery exercises, restoring the application in a failover region within 1 hour of a simulated outage.
- Delivered work in 2-week Agile sprint cycles using backlog refinement, sprint planning, and retrospectives.

Conga | Senior Technical Consultant | 05/2016 – 06/2018

- Worked directly with over 30 clients to scope, build, and deliver custom integration middleware between contract management software and platforms including Workday, Salesforce, and MS Dynamics.
- Maintained 50+ continuously running, business-critical integrations adhering to the OSGi standard using Apache ServiceMix/Karaf.

Novatus Inc. | Technical Services Developer | 03/2015 – 05/2016

- Designed and implemented a reusable data migration service using Hibernate, automating the mapping and creation of contract metadata in a PostgreSQL database for 100+ client onboardings.
- Leveraged JasperReports to deliver regularly scheduled custom reports against PostgreSQL and MSSQL databases per client requirements.
- Led ETL-based migration from MSSQL to PostgreSQL, resolving schema differences and optimizing performance in the target environment.

Novatus Inc. | Technical Support | 03/2014 – 03/2015

- Aided legal teams, procurement departments, and sales professionals by diagnosing and resolving complex issues in an enterprise contract lifecycle management application, working with engineers to identify bugs and validate fixes prior to release.
- Created and maintained client-side unit tests using the Siesta Test Framework and Selenium.

Sanders Company | Field Service Technician Apprentice | 01/2006 – 02/2007

- Maintained programmable logic controllers for wastewater lift stations and installed infrastructure enabling communications to water treatment facilities.

Education

Associate of Science, Political Science

Palm Beach State College | West Palm Beach, FL
